

On-going Specialist Consultancy for Level 4 CAV

Case Study Overview

An established US based client with a Level 4 bespoke EV platform needed an experienced reviewer to fill some specific domain knowledge gaps in their functional safety team.

We helped them to address gaps and alignment between ISO 26262 and other, non-automotive functional safety standards which were applicable to their domain / application.

Successes and Benefits

- We accelerated development by progressing architectural decisions in hardware and software without having to complete all of the functional safety lifecycle steps
- Developed an automotive-biased operational culture
- Rapidly established a software development process at different integrity levels
